Please Note:

The following information is provided in the interests of safety.

- 1). This equipment is mains powered (230 Volts AC) and is therefore potentially hazardous once the cover is removed.
- 2). Only trained engineering staff should attempt any work on the unit with the cover removed.
- 3). While servicing the unit, protect the mains supply to the equipment under test and all electrically powered test equipment with a suitably rated Residual Current Circuit Breaker (rccb) unit. These devices are readily available and are designed to remove the mains supply quickly in the event of a serious leakage of current to earth.
- 4). Ensure all test equipment, and the unit under test is adequately earthed.
- 5). Always discharge the CRT before attempting any work on the high voltage power circuits.
- 6). We advise the use of Electrostatic Damage Prevention equipment when servicing electronic equipment containing static sensitive devices.

SAFETY NOTICE

This service manual is prepared to assist engineers or technicians of repair centers who are in charge of servicing the monitors in the field. The service manual, therefore, is not for users but for those technically oriented service engineers from repair centers who are capable of servicing the unit.

This service manual explains the monitor's outline, detailed features, functions and basic construction of the individual unit or circuit, alignment procedure and the detailed TROUBLE-SHOOTING procedures.

The contents should be read and completely understood before attempting service.

- 1) Make sure the power cord is disconnected before opening the BACK-COVER of the monitor and replacing any parts in the unit.
- 2) While the monitor is in operation, do not attempt to connect or disconnect any wire.
- 3) When the power is on, do not attempt to short any portion of the circuit. This shorting may cause damage to the transistors, ic's or other parts in the unit.
- 4) Operation of the monitor with the cabinet or the BACK-COVER removed involves a shock hazard. The repair or service work on these models should only be performed by those who are thoroughly familiar with the precautions necessary when working on high voltage equipment.
- 5) Do not install, remove, or handle the picture tube in any manner unless shatterproof goggles are worn. People not so equipped shoule be kept away while picture tubes are handled. keep the picture tube away from the body while handling, & donot lift the picture tube by the neck.
- 6) When replacing a chassis in the monitor, all the protective devices must be put back in place, such as, barriers, NON-METALLIC KNOBS, adjustment and compartment shields, and isolation RESISTOR-CAPACITOR, ETC.
- 7) When service is required, observe the original lead dress extra precaution should be taken to ensure correct lead dress in the high voltage circuitry area.
- 8) Always use the manufacturer's replacement parts. Especially critical parts as indicated on the circuit diagram should not be replaced by other manufacturer's. parts furthermore, where a short circuit has occurred, also replace those parts that indicate evidence of overheating.
- 9) Before returning a serviced monitor to the customer, the service technician must throughtly test the unit to be sure that it is completely safe to operate without danger of electrical shock, and must ensure that no protective device built into the monitor by the manufacturer has become defective, or inadvertently defeated during servicing. Especially, the resistance of the connection between the protective earthing terminal and the parts required to be earth shall not exceed 0.1 ohm.

Ergovision 885 Basic Disassembly

The Ergovision 885 is a multi frequency high performance colour display with a 17inch diagonal FST 0.26mm dot pitch CRT.

Control of the picture geometry is achieved using a proprietary micro-controller with 15 factory preset signal timings. User programming of additional signal timings and all user functions is achieved using front mounted digital controls as illustrated below:

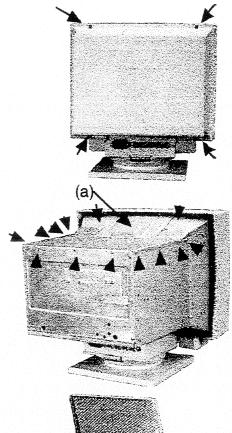

The cabinet is made up of three main plastic parts, the bezel, the rear cover and the tilt base which is detachable. The tilt base does not normally have to be removed for service access.

THE MAINS POWER LEAD SHOULD BE DISCONNECTED BEFORE ATTEMPTING TO DISASSEMBLE THE UNIT.

Removal of 4 self-binding screws (shown right) allows the removal of the rear cover and exposes the inner metal casing necessary for RFI screening.

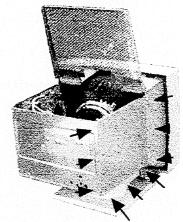

Access to the electronic assemblies begins with the removal of the CRT anode cap shield plate (a). This is held in place with 4 self-tapping screws and two lugs along the top edge. Note that the inner insulating sheet which is attached to this plate is inserted under the surrounding metalwork when the plate is eventually replaced.

The top plate is removed by removing 13 securing screws as indicated.

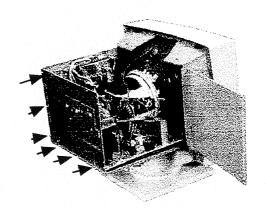

This provides access to the CRT deflection yoke and anode cap where hazardous voltages are present when the unit is powered.

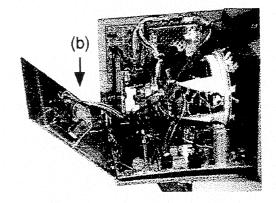

The right hand panel (viewed from behind) should be removed next by removing the 9 screws indicated. This panel is hinged along its forward edge by lugs which interloch with the CRT surround. To remove the plate once the screws have been removed, open the panel outwards and lift it gently off the lugs.

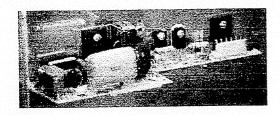

Next, the rear panel is removed by removing the six screw indicated .

One of the power pcbs (b) is mounted on the rear metal panel and the connecting cables to this pcb are only long enough for the panel to be angled to about 45° unless the cables are disconnected.

The final metal panel is difficult to remove because the video processing (c) and amplifier (d) pcbs are mounted on it and again, the length of the connecting cables restricts the movement of the panel until they are disconnected.

There are six screws to remove before the panel may be removed from the main chassis.

Access to the solder side of the main pcb assembly is only possible with the removal of the main pcb , although access to the component side is reasonably good.
